

CONYSO LABS · FOUNDED 2026

Conyso Bench.

The free Lean Six Sigma statistical workbench. Minitab-grade analysis — deterministic, validated against NIST, no AI black box. Use it free in your browser, or self-host to keep your data in-house.

FREE IN YOUR BROWSER · SOURCE-AVAILABLE · SELF-HOST FROM \$49 · NO LLM

105

analyses across 14 families

NIST

StRD-validated to ≥ 10 significant digits

15

calculators · 8 platform tools

440⁺

automated tests — 367 statistical · 69 API · 6 monitor

More than a stats package.

Conyso Bench began as a free alternative to Minitab. It is now a full Lean Six Sigma platform — 105 analyses across 14 families, a deterministic DMAIC copilot, DFSS and Monte-Carlo, Voice-of-Customer, flow and Agile analytics, governance, and a published NIST validation.

Use it free in your browser. When you need it in production with your data staying in-house — on-prem, air-gapped, audit-ready — self-host it. That on-premise data control is the reason regulated teams (pharma, medical device, defense, finance) reach for the self-hosted tier.

And no AI black box. Every number is computed by validated statistical code, not generated by a model — reproducible from a documented algorithm, and defensible in an audit. Built by Conyso Labs.

[See the full Bench vs. Minitab comparison →](#)

The things a desktop tool structurally can't do.

DMAIC Copilot

A deterministic engine that reads your results and recommends the next step — with tollgates and a one-page A3 export. Rule-based, not generative: the same inputs always produce the same guidance.

DFSS & Monte-Carlo

Tolerance simulation, delivery forecasting, and sensitivity analysis. Minitab gates this behind Workspace / Engage; in Bench it ships in the base build.

Voice of Customer

Survey and Likert analysis with Cronbach's α , plus automatic comment Pareto — free-text categorised and ranked without an LLM.

Flow & Agile

Cycle-time analytics and a Monte-Carlo “when will it be done” forecast — the services-and-software side of Lean Six Sigma, where desktop tools are weakest.

Conyso Originals

Analyses you won't find anywhere else — like the Variance Budget, which attributes total variation to its sources in a single view.

Shareable, embeddable results

Every analysis is a live URL you can link or embed — not a `.mpx` file mailed around. Results travel to where the decision is made.

Live data connector

Point Bench at a published Sheet or CSV URL and refresh in one click. The analysis stays current as the data moves.

Governance

Lock a verified result and keep an append-only audit trail — who ran what, against which data, when. Recorded, not remembered.

Numerical validation

Bench publishes its reproduction of the NIST StRD reference datasets, agreeing to ≥ 10 significant digits. The trust wedge no closed tool publishes.

Conyso Bench Monitor

A separate, self-contained continuous-SPC watchdog — its own deployable — that watches a live process and alerts on out-of-control signals.

WHAT'S IN THE BOX

A full Black Belt toolkit.

Hypothesis tests

28 tests — one-sample, two-sample, k-sample, paired (including McNemar for binary paired), and the non-parametric equivalents (Mann-Whitney, Wilcoxon, Kruskal-Wallis, Friedman, Mood's median, sign test, runs, Grubbs, Dixon Q, Fisher's exact). Post-hoc comparisons include Tukey HSD, Fisher LSD, Games-Howell, Dunnett, and Hsu MCB. Pre-flight assumption checks and a Test Chooser wizard whose every recommendation drops you into the right form — no broken paths.

Control charts

13 chart types — Xbar/R, Xbar/S, I-MR, MA, p, np, c, u, CUSUM, EWMA, Hotelling T^2 , MEWMA, Laney p' (overdispersion-adjusted), Z-MR (short-run). Western Electric and Nelson rules applied automatically. The multivariate and overdispersion-adjusted specialties Minitab markets as paid features ship as standard. Annotate any point. Save any chart as a recipe.

Capability analysis

Cp / Cpk / Pp / Ppk / Cpm / Z-bench, computed properly — σ_{within} from subgroup $\bar{R}/d_2$ (AIAG) or moving-range $M\bar{R}/1.128$ for individuals, not collapsed to overall sigma. Attribute capability for binomial and Poisson processes. Full Gauge R&R in all three designs — crossed, nested (parts nested in operators for destructive testing), expanded (extra variance sources via factor_cols) — all three implemented and dispatched. The Capability Sixpack on a single screen. Predictive Cpk for what-if scenarios.

Regression and DOE

The full regression ladder, each reachable from the Method dropdown — OLS, GLM, logistic and ordinal, robust, quantile, ridge / lasso / elastic-net, PLS, spline, and random forest. DOE covers factorial, fractional, response-surface, and D- and I-optimal designs, with power and sample-size. Multi-response Derringer-Suich desirability optimisation.

Multivariate, time series & reliability

PCA, LDA, clustering, MANOVA, and factor analysis. ARIMA and auto-ARIMA with decomposition and ACF / PACF. GEE and GLMM for correlated and hierarchical data, plus Bayesian methods. Reliability and survival analysis across nine distributions including Weibull, with right-censoring throughout.

Sample size & power

Eleven case-types covering one/two-sample t, paired t, one/two-proportion, one-variance, one-way ANOVA, correlation, chi-square goodness-of-fit, equivalence, and Poisson rate.

DMAIC project layer

Every workspace can hold projects with five tracked phases (Define / Measure / Analyze / Improve / Control), default checklists per phase, and pinned analyses. A Process Health Score per project blends Cpk (40%), control-chart violations (30%), MSA acceptability (15%), and trend stability (15%) into one number.

Seventeen LSS deliverable templates

Charter, SIPOC, A3, FMEA (auto-RPN), AIAG-style Control Plan, 8D, Voice-of-Customer/CTQ, Pugh matrix, Capability Report, MSA Report, Tollgate Deck, Closure Report, Kaizen, 5S, RACI, Stakeholder, and an IQ/OQ/PQ Validation Kit Stub — each renderable to HTML, Markdown, Word, or PowerPoint (one slide per section).

The UX layer other tools don't have

A Test Chooser wizard that picks the right test from three or four questions — and routes every recommendation to a real form, McNemar through Hsu MCB. A plain-English query bar that fills the form. Pre-flight traffic lights for assumption violations. A "what this means" interpreter that gives every result a plain-English paragraph. Rule-based action plans — "Cpk = 0.6 → run Gauge R&R first; takes a day, saves you a week." An eight-step anchored-spotlight guided tour on first launch — a real anchored tour with a bronze pulse-ring around the actual target element, not a popup; replayable from the header.

Every result is a cross-link

Below every result card: *Learn more* · *Method provenance* · *Run again*. The Methods page has Run / Open affordances per row. Guides have in-text runnable links. One `navigate()` router; consistent `data-nav-*` attributes across the SPA. The whole tool is densely interconnected — click a method anywhere, you are in the form.

DMAIC phase recommendations

Each project phase surfaces a pill-button row of recommended analyses — Pareto for Define, MSA + Baseline Cpk for Measure, ANOVA + Hsu MCB + Regression for Analyze, DOE + Multi-response desirability for Improve, I-MR + Tolerance interval for Control.

The community decides the roadmap

Bench ships with an in-app feedback board. Anyone can submit a feature request or a bug; everyone can upvote or downvote. Top-voted items feed the next development cycle. The roadmap is not closed.

Learn, in the workbench

In-app Learning Paths and sample datasets — free for a whole cohort — alongside fourteen in-depth guides, ~25 FAQs, and a per-method reference where every row drops you into the analyser. Bench ships with 440+ automated tests (367 statistical · 69 API · 6 monitor) — CI-runable and citable — and publishes its NIST StRD reproduction to ≥ 10 significant digits.

A Capability run, end-to-end.

Cycle time on a 248-sample run. Bench computes Cp, Cpk, Pp, Ppk against your spec limits, returns the σ_{within} from subgroups (not the overall sigma shortcut), plots the distribution against LSL / USL, and writes the interpretation in plain English — including the predicted defect rate in DPMO and the off-centring in process-sigma units. Pin, save, copy, CSV, delete. Every analysis carries the same affordances.

Capability (Cpk) · Conyso Bench · hosted at bench.conyso.com

BENCH, LENS, AND BILL

The math, the picture, the AI.

Bench is the math. Lens is the picture. Bill is the AI on top. Bench is the deterministic math layer; Bill is the AI Green Belt built on it. Bench stands alone, free — and it is also the engine Bill calls under the hood, and the dataset Lens will visualise.

Because Bench is deterministic and verifiable — every number traceable to a documented algorithm, the whole engine reachable over an API — an AI layer can sit on top without ever guessing at the statistics. Bill decides which analyses to call and how to read them; Bench does the math, the same way every time.

PRICING

Free in the browser. Yours to keep, self-hosted.

Run the full workbench in your browser at no cost. Self-host when you need your data to stay in-house — a one-time licence, perpetual, far less than a single Minitab seat for one year.

BROWSER

Free

at bench.conyso.com

The full Bench, in your browser. No signup to try. Your fastest start — and free for everyone, always.

SELF-HOST · INDIVIDUAL

\$49

one-time · perpetual

Run it on your own machine, offline, your data private. A perpetual licence with updates included.

SELF-HOST · COMPANY

\$499

one-time · perpetual

Production use on your own infrastructure — your data never leaves your building. Optional 20%/yr for updates, and 3 months of Bill included. Less than one Minitab seat for a single year.

\$499 once vs. Minitab at **~\$1,700 per seat, every year**. Self-hosting is a single `docker compose up` — SQLite and filesystem storage, no Postgres, no Redis, no S3.

Questions about self-hosting or volume licensing? Email hello@conyso.com or [send us a note](#) — we'll walk you through it. [Full pricing & licence FAQ](#) →

WHY SELF-HOST IS PAID

A fair price keeps it independent.

Bench is free in your browser, for everyone — cost is never the barrier to using it. The self-hosted tier is paid because it exists for one reason: keeping your data inside your own walls, where regulated and privacy-driven teams need it. That is real, commercial value, and we price it honestly.

We could have made it free and lived on ads, harvested data, or grant cycles. We'd rather charge a fair, one-time price — \$49 for an individual, \$499 for a company — and stay independent. It funds the engine's upkeep, keeps the source public, and means Bench answers to the people who run it, not to whoever pays to steer it.

And it opens regardless: four years after each release, that version becomes fully open-source under AGPL-3.0.

LICENSE

Source-available, open in four years.

Conyso Bench is released under the Business Source License 1.1. The full source is public from day one — read every algorithm, learn from it, run it. Four years after each release, that version automatically converts to the GNU AGPL-3.0 — fully open-source.

Source-available today, open-source tomorrow: free in your browser, fair for companies. [How the licence works →](#) · [read the LICENSE ↗](#) (<https://github.com/conyso/bench/blob/main/LICENSE>). For hosting and commercial questions, hello@conyso.com.
